EXECUTIVE SUMMARY

As part of the economic analysis of the State of Texas Port and Maritime Transportation System conducted by Martin Associates, a separate report was prepared for the Port of Beaumont to summarize the economic impacts generated by marine cargo activity at the marine terminals located at the Port of Beaumont. In 2015, these terminals handled 3.9 million tons of aggregate, grain, steel, forest products and liquid bulk.

This study focuses on impacts generated by marine cargo activity in the year 2015. Impacts are estimated in terms of jobs, personal earnings, business revenue, and state and local taxes. In addition to the baseline impact estimates, computer models specific to each terminal operation have been prepared that can be used in evaluating the sensitivity of impacts to changes in tonnage, commodities, inland transportation modes, vessel size and the use of barges. The model can also be used for annual updates.

Exhibit E-1 graphically demonstrates how seaport activity impacts the local and regional economies. As this exhibit indicates, the marine cargo and vessel activity initially generates business revenue to the firms supplying marine services. This revenue is used to purchase employment (direct jobs) to provide the services, to pay stockholders and for retained earnings, and to purchase goods and services from local firms, as well as national and international firms (creating indirect jobs with these firms). Businesses also pay taxes from the business revenue.

Exhibit E-1
Flows of Economic Impacts through the Economy

The employees hired by the firms receive wages and salaries (personal income), a portion of which is saved, while another portion is used to buy goods and services such as food, housing, clothing, health care, etc. These purchases create a re-spending impact throughout the economy, known as the personal income multiplier. As a result of these local purchases, additional jobs (known as induced jobs) are created in the local economy. Finally, taxes are paid by individuals employed with the firms providing the services to the marine terminals.

As demonstrated by this chart, four types of impacts are measured:

- Jobs
- Employee earnings
- Business revenue
- State and local taxes

With respect to jobs, four types of job impacts are measured. These are direct, induced, indirect and related jobs. The job impacts are defined as follows:

- Direct jobs are those jobs with local firms providing support services to the seaport. These jobs are dependent upon this activity and would suffer immediate dislocation if the seaport activity were to cease. Seaport direct jobs include jobs with railroads and trucking companies moving cargo to and from Port of Beaumont's marine terminals, barge operators, marine construction firms and port tenants.
- Induced jobs are jobs created locally and throughout the regional economy due to purchases of goods and services by those directly employed. These jobs are with grocery stores, the local construction industry, retail stores, health care providers, local transportation services, etc., and would also be discontinued if seaport activity were to cease.
- Indirect jobs are those jobs generated in the local economy as the result of local purchases by the firms directly dependant upon seaport activity. These jobs include jobs in local office supply firms, equipment and parts suppliers, maintenance and repair services, etc.
- Related jobs are estimated for marine cargo activity only, and are users of the steel, forest products and grain moving over the port facilities. Related jobs are not dependent upon the seaport marine terminals to the same extent as are the direct, induced and indirect jobs. For example, these firms can and do use other ports. It is the demand for the final product not the use of a particular seaport or marine terminal. It is to be emphasized that the employment with firms counted as directly dependent upon the port activities are excluded from the related jobs to avoid double counting.

The employee earnings consist of wages and salaries and include a re-spending effect (local purchases of goods and services by those directly employed), while business revenue consists of total business receipts by firms providing services in support of the marine activity. State and local taxes include taxes paid by individuals, as well as firms dependent upon the seaport activity.

The study is based on interviews with firms providing services to the cargo and vessels handled at the Port of Beaumont. These interviews are included in the statewide economic impact analysis in which the data collection consisted of interviews with 2,106 firms providing maritime services in the State of Texas. In many cases, especially with lines and agents, miscellaneous maritime services, tug and barge companies, and maritime construction firms, these firms were providing maritime services at more than one port in the analysis. In this situation in which one firm provides services at multiple ports, care was taken to allocate the level of activity to the Port of Beaumont marine terminals. These firms represent more than 98 percent of the firms in the Port of Beaumont seaport community, underscoring the defensibility of the study. Furthermore, the impacts can be traced back to the individual firm. The data collected from the interviews were then used to develop an operational model of the public and private marine terminals located at the Port of Beaumont.

SUMMARY OF IMPACTS GENERATED BY THE PORT OF BEAUMONT

The economic impacts generated by the Port of Beaumont are summarized in Exhibit E-2.

Exhibit E-2
Summary of the Local and Regional Economic Impacts Generated by
Port of Beaumont

PORT OF BEAUMONT (PUBLIC)	
JOBS	
Direct	745
Induced	884
Indirect	1,091
Related Users	<u>9,888</u>
TOTAL JOBS	12,608
PERSONAL INCOME (\$ Millions)	
Direct	\$42.03
Re-Spending/Local Consumption	\$111.31
Indirect	\$51.68
Related User Income	<u>\$360.40</u>
TOTAL PERSONAL INCOME	\$565.41
REVENUE/ECONOMIC OUTPUT (\$ Millions)	
Direct Business Revenue	\$137.81
Local Purchases	\$111.57
Related Users Output	<u>\$1,532.00</u>
TOTAL REVENUE	\$1,781.38
STATE AND LOCAL TAXES (\$ Millions)	
Direct	\$3.15
Re-Spending/Local Consumption	\$8.35
Indirect	\$3.88
Related User Taxes	<u>\$27.03</u>
TOTAL TAXES	\$42.41

Specifically, the vessel and cargo activity at the Port of Beaumont generated the following impacts in the State of Texas in 2015:

- **12,608 jobs in Texas** are in some way related to the cargo moving via the public and private marine terminals at the Port of Beaumont.

- Of the 12,608 jobs, **745 direct jobs** are generated by the marine cargo and vessel activity. The majority of the direct jobs are created by the movement of project cargo/military cargos, grain and crude oil.
- As the result of local and regional purchases by those 745 individuals holding the direct jobs, an additional **884 induced jobs** are supported in the regional economy.
- **1,091 indirect jobs** were supported by \$111.6 million of local purchases by businesses supplying services at the marine terminals and by businesses located at the Port of Beaumont.
- **9,888 jobs were with users of the Port** and these users are not as directly impacted by the Port activity as are the direct, indirect and induced jobs, in that the jobs with importers and exporters using the Port could and do use other ports for the shipment and receipt of cargo.

In 2015 marine cargo activity at the public and private marine terminals at the Port of Beaumont supported a total of \$1.8 billion of economic activity in the State of Texas.

- Of the \$1.8 billion, \$137.8 million is the direct business revenue received by the firms directly dependent upon the Port and providing maritime services and inland transportation services to the cargo handled at the marine terminals and the vessels calling the ports. An additional \$1.5 billion represents the value of the output to the State of Texas that is created due to the cargo moving via the Port of Beaumont. This includes the value added at each stage of producing an export cargo, as well as the value added at each stage of production for the firms using imported raw materials and intermediate products that flow via the marine terminals and are consumed within the State. In addition, \$111.3 million of the re-spending of personal income and local consumption purchases are supported in the Texas economy. These components are additive and represent independent monetary impacts supported by the cargo and vessel activity. Other dollar value impact measures are not included in the total economic value since they are interdependent. Direct income is not included since it is part of the direct business impact and similarly, local purchases by the firms are from the direct business revenue generated by port activity, and also used to pay indirect income. Finally, taxes are paid by the individuals from the direct, induced, indirect and related income and the direct business revenue and the related output.
- Marine activity supported \$565.4 million of total personal wage and salary income and local consumption expenditures for Texas residents in 2015. This includes \$205.0 million of direct, indirect, induced and local consumption expenditures, while the remaining \$360.4 million was received by the related port users. The 745 direct job holders received \$42.0 million of direct wage and salary income, for an average salary of \$56,416.

A total of \$15.4 million of direct, induced and indirect state and local tax revenue was generated by cargo maritime activity at the marine terminals located at the Port of Beaumont. In addition, \$27.0 million of state and local taxes were created due to the economic activity of the related users of the cargo moving via the public and private marine terminals. The total tax impact, including the impact of the related port users is \$42.4 million.

I. OVERVIEW OF THE ANALYSIS AND SUMMARY OF METHODOLOGY

As part of the economic analysis of the State of Texas Port and Maritime Transportation System conducted by Martin Associates, a separate report was prepared for the Port of Beaumont to summarize the economic impacts generated by marine cargo activity at the marine terminals at the Port of Beaumont. In 2015, the public and private marine terminals handled 3.9 million tons of aggregate, grain, steel, forest products and liquid bulk.

The methodology used in this analysis has been developed by Martin Associates and has been used to estimate the economic impacts of seaport activity at public and private marine terminals of more than 300 United States and Canadian ports.

The remainder of this chapter presents an overview of the economic impact analysis and consists of the following sections:

- Flow of economic impacts through the local and regional economies;
- The structure of the impact analysis;
- Summary of the methodology; and
- Commodities included in the analysis.

1. FLOW OF IMPACTS

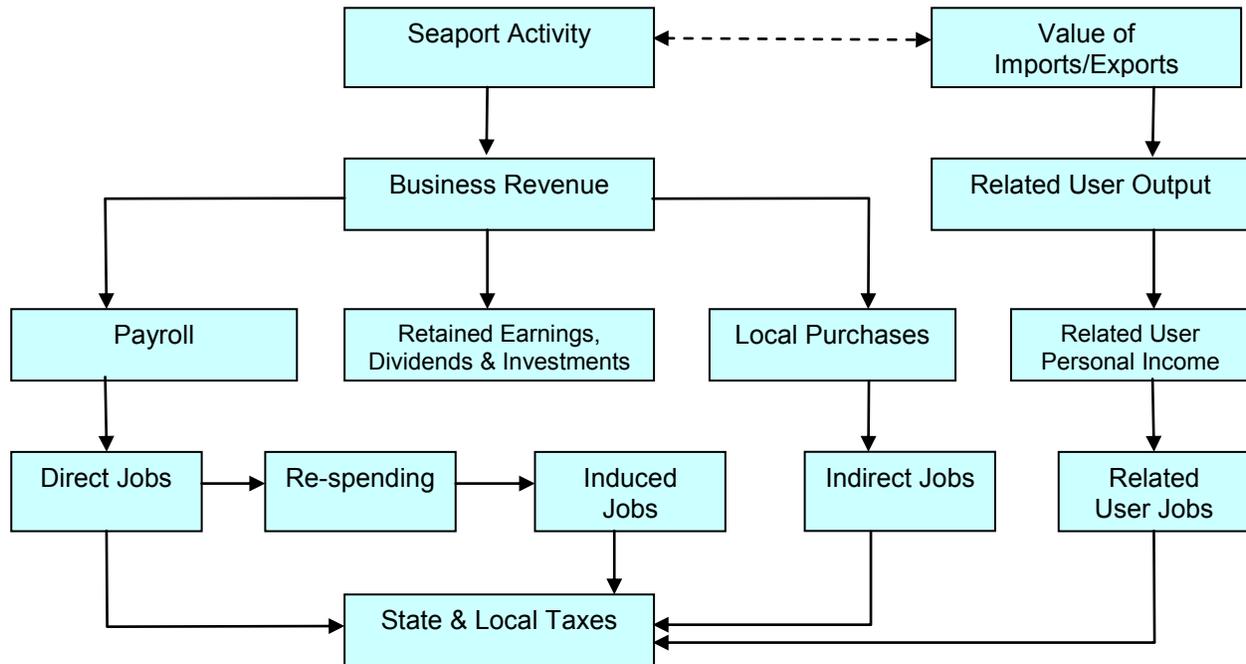

Waterborne activity at a seaport contributes to the local and regional economy by generating business revenue to local and national firms providing vessel and cargo handling services at the marine terminals. These firms, in turn, provide employment and income to individuals, and pay taxes to state and local governments. Exhibit I-1, on the following page, shows how activity at marine terminals generate impacts throughout the local, state and national economies. As this exhibit indicates, the impact of a seaport on a local, state or national economy cannot be reduced to a single number, but instead, the seaport activity creates several impacts. These are the revenue impact, employment impact, personal income impact, and tax impact. These impacts are non-additive. For example, the income impact is a part of the revenue impact, and adding these impacts together would result in double counting. Exhibit I-1 shows graphically how activities at Port of Beaumont's marine terminals generate the four impacts.

1.1 Business Revenue Impact

At the outset, activity at the port generates business revenue for firms which provide services. This business revenue impact is dispersed throughout the economy in several ways. It is used to hire people to provide the services, to purchase goods and services, and to make Federal, state and local tax payments. The remainder is used to pay stockholders, retire debt, make investments, or is held as retained earnings. It is to be emphasized that the only portions of the revenue impact that can be definitely identified as remaining in the local economy are those portions paid out in salaries to local

employees, for local purchases by individuals and businesses directly dependent on the seaport, and in contributions to state and local taxes.

Exhibit I-1
Flow of Economic Impacts Generated By
Marine Activity

1.2 Employment Impact

The employment impact of seaport activity consists of four levels of job impacts.

- Direct employment impact - jobs directly generated by marine cargo activity. Direct jobs generated by marine cargo include jobs with railroads and trucking companies moving cargo between inland origins and destinations and the marine terminals and terminal operators located at the Port of Beaumont. It is to be emphasized that these are classified as directly generated in the sense that these jobs would experience near term dislocation if the cargo and vessel activity at Port of Beaumont were to be discontinued.
- Induced employment impact - jobs created throughout the local economy because individuals directly employed due to seaport activity spend their wages locally on goods and services such as food, housing and clothing. These jobs are held by residents located throughout the region, since they are estimated based on local and regional purchases.

- Indirect Jobs - are jobs created locally due to purchases of goods and services by firms, not individuals. These jobs are estimated directly from local purchases data supplied to Martin Associates by the companies interviewed as part of this study, and include jobs with local office supply firms, maintenance and repair firms, parts and equipment suppliers, etc. It is to be emphasized that special care was taken to avoid double counting, since the current study counts certain jobs as direct (i.e., trucking jobs, jobs with railroads, jobs with insurance companies and admiralty law firms, etc.) which are often classified as indirect by other approaches, notably the input/output model approach.
- Related jobs are estimated for marine cargo activity only, and are users of the steel, forest products and grain moving over the port facilities. Related jobs are not dependent upon the seaport marine terminals to the same extent as are the direct, induced and indirect jobs. For example, these firms can and do use other ports. It is the demand for the final product not the use of a particular seaport or marine terminal. It is to be emphasized that the employment with firms counted as directly dependent upon the port activities are excluded from the related jobs to avoid double counting.

1.3 Personal Earnings Impact

The personal earnings impact is the measure of employee wages and salaries (excluding benefits) received by individuals directly employed due to seaport activity. Re-spending of these earnings throughout the regional economy for purchases of goods and services is also estimated. This, in turn, generates additional jobs -- the induced employment impact. This re-spending throughout the region is estimated using a regional personal earnings multiplier, which reflects the percentage of purchases by individuals that are made within the State of Texas. The re-spending effect varies by region -- a larger re-spending effect occurs in regions that produce a relatively large proportion of the goods and services consumed by residents, while lower re-spending effects are associated with regions that import a relatively large share of consumer goods and services (since personal earnings "leak out" of the state for these out-of-state purchases). The direct earnings are a measure of the local impact since they are received by those directly employed by seaport activity.

1.4 Tax Impact

Tax impacts are tax payments to the state and local governments by firms and by individuals whose jobs are directly dependent upon and supported (induced jobs) by activity at the marine terminals.

2. IMPACT STRUCTURE

The four types of economic impacts are created throughout various business sectors of the state and local economies. These sectors include:

- Surface Transportation Sector;
- Maritime Services Support Sector;
- Port Authority

Within each sector, various participants are involved. Separate impacts are estimated for each of the participants. A discussion of each of the economic impact sectors is provided below, including a description of the major participants in each sector.

2.1 The Surface Transportation Sector

The surface transportation sector consists of railroads, trucking firms and pipeline operations moving cargo to and from the marine terminals.

2.2 The Maritime Services Sector

This sector consists of numerous firms and participants performing functions related to the following maritime services:

- Cargo Marine Transportation;
- Vessel Operations;
- Cargo Handling; and
- Federal, State and Local Government Agencies.

A brief description of the major participants in each of these four categories is provided below:

- Cargo Marine Transportation - Participants in this category are involved in arranging for inland and water transportation for export or import freight. The freight forwarder/customshouse broker is the major participant in this category. The freight forwarder/customshouse broker arranges for the freight to be delivered between the terminals and inland destinations, as well as the ocean transportation. This function performed by freight forwarders and customshouse brokers is most prevalent for containerized and general cargo commodities.
- Vessel Operations - This category consists of several participants. The steamship agents provide a number of services for the vessel as soon as it enters the port; the agents arrange for pilot services and towing, for medical and dental care of the crew, and for ship supplies. The agents are also responsible for vessel documentation. In addition to the steamship agents arranging for vessel services, those providing the services include:
 - Chandlers - supply the vessels with ship supplies (food, clothing, nautical equipment, etc.)
 - Towing firms - provide the tug service to guide the vessel to and from port and provide towing services to barges calling a port.

- Pilots - assist in navigating the vessels to and from marine terminals within a port.
- Bunkering firms - provide fuel to the vessels and tugs
- Marine surveyors - inspect the vessels and the cargo
- Shipyards/marine construction firms - provide repairs, either emergency or scheduled as well as marine pier construction and dredging.
- Cargo Handling - This category involves the physical handling of the cargo at the terminals between the land and the vessel. Included in this category are the terminal operators that operate the maritime terminals where cargo is loaded and off-loaded. In this study employment with the Port tenants and chemical companies on the barge canal are included in this category.
- Government Agencies - This service sector involves federal, state and local government agencies that perform services related to cargo handling and vessel operations at the Port. US Customs, Bureau of Immigration, US Department of Labor, US Department of Agriculture, US Coast Guard, the Army Corps of Engineers, and US Department of Commerce employees are involved.

2.3 Port of Beaumont

The Port of Beaumont governmental entity includes those individuals employed whose purpose is to oversee port activity at the Port of Beaumont.

3. SUMMARY OF METHODOLOGY

The purpose of this section is to provide a summary of the methodological approach used to estimate the economic impacts of the vessel and cargo activity at the Port of Beaumont public and private marine terminals.

3.1 Data Collection

The cornerstone of the Martin Associates approach is the collection of detailed baseline impact data from firms providing services in support of operations at the Port of Beaumont. To ensure accuracy and defensibility, the baseline impact data was collected from interviews with maritime firms in the Beaumont maritime community, as well as additional interviews with firms included in the statewide economic impact analysis of which a total of 2,106 interviews were conducted for the statewide analysis. In cases in which one firm provides services at multiple ports, care was taken to allocate the level of activity at the Port of Beaumont's marine terminals. These firms represent the universe of firms providing services at the Port of Beaumont.

3.2 Direct Jobs, Income, Revenue, and Tax Impacts

The results of these interviews were then used to develop the baseline direct job, revenue and income impacts for the economic sectors and job categories associated with Port of Beaumont's terminals.

The direct tax impacts are estimated at a state, county and local level based on state and local per capita tax burdens as developed by the Tax Foundation.

This baseline survey data was also used to develop an operational model which can be used to update the impacts of the Port of Beaumont's marine terminals and private terminals on an annual basis and to evaluate the impacts of changes in:

- Marine cargo tonnage, by commodity;
- Modal distribution of seaport cargo (what percent of the inland transportation of a commodity is truck versus rail versus pipeline), as well as the geographical distribution of each commodity; and
- Number of barge and vessel calls and size of tows.

Also, the operational model can be used to evaluate alternative facilities expansion projects and new marine terminal construction, as well as the impacts associated with channel dredging and widening.

3.3 Induced Impacts

Induced impacts are those generated by the purchases of the individuals employed as a result of seaport activity. For example, a portion of the personal earnings received by those directly employed due to activity at the marine terminals is used for purchases of goods and services, both regionally, as well as out-of-the region. These purchases, in turn, create additional jobs in the region which are classified as induced. To estimate these induced jobs, a regional personal earnings multiplier was developed from data provided by the Bureau of Economic Analysis, Regional Income Division. This personal earnings multiplier is used to estimate the total personal earnings generated in the region as a result of the activity at the Port of Beaumont. A portion of this total personal earnings impact is next allocated to specific local purchases (as determined from consumption data for Beaumont area residents, as developed from the US Bureau of Labor Statistics, Consumer Expenditure Survey, 2014). These purchases are next converted into retail and wholesale induced jobs in the regional economy.

Induced jobs are not estimated at lower levels of purchasing rounds (after the wholesale round) since it is not possible to trace with a sufficient degree of accuracy, geographically, where purchases at the remaining levels occur. However, about 80 percent of the consumption will likely occur at the first two rounds of purchases, which are most likely local retail and wholesale purchases.

3.4 Indirect Jobs

Indirect jobs are generated in the local economy as the result of purchases by firms that are directly dependent upon cargo and vessel activity at the marine terminals, including the dependent shippers/consignees. These purchases are for goods and services such as office supplies and equipment, maintenance and repair services, communications and utilities, transportation services and other professional services. To estimate the indirect economic impact, local purchases, by type of purchase, were collected from each of the firms interviewed. These local purchases were then combined with employment to sales ratios in local supplying industries, developed from the US Bureau of Economic Analysis Regional Input-Output Modeling System for the state of Texas. The indirect job ratios also account for the in-state spin-off effects from multiple rounds of supply chains that are required to provide the locally purchased goods and services.

3.5 Related Impacts

Related impacts measure the jobs with shippers and consignees moving cargo through the Port's marine terminals and private terminals. These impacts are classified as related jobs, since the shippers/consignees using the marine terminals for the movement of cargo can and do use other seaports and marine terminals. Because of the proximity of other ports and the associated steamship service at these ports, such as Galveston, Port Arthur, Texas City and Houston, the exporters and importers have some flexibility in port choice. As a result, impacts with the importers and exporters cannot be counted as dependent upon the public and private marine terminals at the Port of Beaumont.

These related impacts are estimated based on the value per ton of each cargo exported and imported via the Port and the associated job to value of output ratio for the associated producing or consuming sector in Texas, as developed from the Bureau of Economic Analysis Regional Input-Output Modeling System (RIMS II) for the State.

4. COMMODITIES INCLUDED IN THE ANALYSIS

A major use of an economic impact analysis is to provide a tool for port development planning. As a port grows, available land and other resources for port facilities become scarce, and decisions must be made as to how to develop the land and utilize the resources in the most efficient manner. Various types of facility configurations are associated with different commodities. For example, liquid fertilizer requires tankage for storage, while dry bulk cargo requires covered storage and open storage, as well as conveyor systems.

An understanding of the commodity's relative economic value in terms of employment and income to the local community, the cost of providing the facilities, and the relative demand for the different commodities is essential in making future port development plans. Because of this need for understanding relative commodity impacts, economic impacts are estimated for the following commodities handled at the public and private marine terminals:

- Grain
- Aggregate
- Other Dry Bulk
- Bagged Agri Products
- Forest Products
- Steel
- Project Cargo
- Crude Oil

It should be emphasized that commodity-specific impacts are not estimated for each of the economic sectors described in the last section. Specific impacts by commodity could not be allocated to individual commodities with any degree of accuracy for marine construction, ship repair, or the state and federal government. In addition, taxes have not been displayed by specific commodity since these tax impacts will reflect the same distribution over commodities as the employment impact.

II. MARITIME EMPLOYMENT IMPACTS

In this chapter, the employment generated by maritime cargo activity at the marine terminals within the Port of Beaumont is estimated. The chapter is organized as follows:

- First, the total employment that is in some way related to the cargo and vessel activities at the complex is estimated.
- Second, the subset of total employment that is judged to be totally dependent (i.e., direct jobs) on port activity is analyzed as follows:
 - The direct job impact is estimated by detailed job category, i.e., terminal operations, trucking, freight forwarders/customhouse brokers, steamship agents, chandlers, surveyors, shipyards, etc.
 - The direct job impact is estimated for each of the key commodities/commodity groups.
- The direct job impact is estimated based on the residency of those directly employed.
- Induced and indirect jobs are estimated.

1. TOTAL MARINE CARGO EMPLOYMENT IMPACT

It is estimated that about 12,608 jobs are directly or indirectly generated by port activities at the public and private marine terminals at the Port of Beaumont. Of the 12,608 jobs:

- 745 jobs are directly generated by activities at the public and private marine terminals at the Port of Beaumont and if such activities should cease, these jobs would be discontinued over the short term.
- 884 jobs (induced jobs) are supported by the local purchases of the 745 individuals directly generated by port activity at the marine terminals. An additional 1,091 indirect jobs were supported by \$111.6 million of purchases in the local and regional economy by firms providing direct cargo handling and vessel services, as well as the dependent terminal operations.
- 9,888 jobs were with related users of the Port and these users are not as directly impacted by the Port activity as are the direct, indirect and induced jobs, in that the jobs with importers and exporters using the Port could and do use other ports for the shipment and receipt of cargo. These users were related to the steel, grain and forest products handled at the terminals at the Port of Beaumont.

2. DIRECT MARINE CARGO JOB IMPACTS

In 2015, 3.9 million tons of domestic and foreign waterborne cargo moved via the Port of Beaumont. As a result of this activity, 745 full-time jobs were directly created.¹ In this section the jobs are analyzed in terms of:

- Distribution by job category;
- Distribution by commodity group; and
- Distribution by county and state of residency.

2.1 Job Impacts by Job Category

Exhibit II-1 presents the distribution of the 745 direct jobs by job category. The exhibit indicates that the majority of direct jobs are with the ILA workers and the truckers moving the project cargo/military cargos and steel products, followed by the terminal operators.

Exhibit II-1
Employment Impacts by Sector and Job Category

PORT OF BEAUMONT	TOTAL DIRECT JOBS
SURFACE TRANSPORTATION	
Rail	53
Truck	201
MARITIME SERVICES	
Terminal	100
ILA	203
Tug Assist	4
Pilots	5
Agents	16
Maritime Services/Construction	48
Freight Forwarders	39
Government	24
Barge/Bunkers	3
Chandler/Surveyors	8
PORT OF BEAUMONT	40
TOTAL	745

¹ Jobs are measured in terms of full-time worker equivalents. If a worker is employed only 50 percent of the time by activity at the public and private marine terminals, then this worker is counted as .5 jobs.

2.2 Direct Job Impacts by Commodity

Most of the 745 jobs considered to be generated by port activity can be associated with the handling of specific commodities or commodity groups. Certain employment categories such as government employees and employees with marine construction and ship repair cannot be identified with a specific commodity. As a result, employment in these three groups (which totaled 75 jobs) was not allocated to commodity groups.

Exhibit II-2 presents the relative employment impacts in terms of commodity groups.

Exhibit II-2
Distribution of Direct Job Impact by Commodity

PORT OF BEAUMONT	TOTAL DIRECT JOBS
Bagged Agri Products	45
Forest Products	46
Steel	27
Project Cargo	227
Aggregate	97
Grain	127
Crude Oil	64
Not Allocated	<u>113</u>
TOTAL	745

Project cargo created the largest number of direct jobs, 227 jobs, followed by the 127 jobs created by the movement of grain over the marine terminals at the Port of Beaumont.

3. DISTRIBUTION OF DIRECT JOBS BY PLACE OF RESIDENCE

To underscore the geographic scope of the impacts generated by the public and private marine terminals at the Port of Beaumont, Exhibit II-3 presents the distribution of the 745 direct jobs by place of residency. The residency analysis is based on the results of the interviews. As this exhibit indicates, about 66% of the direct jobs are held by residents of the City of Beaumont and other Jefferson County.

Exhibit II-3
Distribution of Direct Jobs by Place of Residency

PORT OF BEAUMONT		
JURISDICTION	SHARE	TOTAL DIRECT JOBS
Beaumont	46.79%	349
Orange	2.30%	17
Port Arthur	5.79%	43
Hardin	6.51%	49
Jefferson	13.72%	102
Orange	7.72%	58
Other Texas	16.61%	124
Other US	0.57%	4
TOTAL	100.00%	745

4. INDUCED JOBS

The 745 directly employed individuals due to activity at the public and private marine terminals at the Port of Beaumont received wages and salaries, a part of which was used to purchase local goods and services such as food, housing, clothing, transportation services, etc. As a result of these local purchases, 884 induced jobs in the regional economy were supported. The majority of the induced jobs are with local and regional private sector social services, business services and educational services, followed by induced jobs in the food and restaurant sector, and by jobs in the construction and home furnishings sector of the local economy.

5. INDIRECT JOBS

In addition to the induced jobs generated by the purchases by directly employed individuals, the firms providing the direct services and employing the 745 direct jobs make local purchases for goods and services. These local purchases by the firms dependent upon the public and private marine facilities at the Port of Beaumont generate additional local jobs -- indirect jobs. Based on interviews with the tenants and service providers, these firms made \$111.6 million of local and in-state purchases in 2015. These direct local purchases created an additional 1,091 indirect jobs in the local economy.

6. RELATED JOBS

It is estimated that about 9,888 jobs with Texas shippers and consignees are related to grain, forest products and steel received at the facilities located at the Port of Beaumont. To estimate these related jobs, Martin Associates developed ratios of jobs to the value of tonnage for the relevant export and import commodities. The jobs per value of output data for the relevant industries in Texas were

developed from the US Bureau of Economic Analysis, RIMS II. The jobs per output value coefficients were multiplied by value per ton and tonnage of each cargo shipped or received via the public and private marine terminals to estimate the related jobs. Care was taken to avoid double counting of the direct, induced and indirect jobs created by moving the cargo over the marine terminals.

It is to be emphasized that these are related jobs, and would not likely disappear if the marine terminals were to close to marine cargo and vessel/barge activity. Given a level of demand for the specific cargo, other ports would be used to move the cargo.

III. MARINE CARGO REVENUE, INCOME AND TAX IMPACTS

The 3.9 million tons of cargo handled at the Port of Beaumont generated revenue for firms in each of the economic sectors. For example, revenue is received by the railroads and the trucking companies within the surface transportation sector as a result of moving export cargo to the marine terminals and distributing the imported commodities inland after receipt at the marine terminals. The firms in the maritime services sector receive revenue from arranging and providing transportation services, cargo handling, and providing services to vessels in port. In addition, revenue is received by shippers/consignees from the sales of cargo shipped or received via the marine cargo terminals and from the sales of products made with raw materials received through the terminals.

The revenue generated by port activity consists of many components. For example, gross revenue is used to pay employee salaries and taxes, it is distributed to stockholders of the companies providing the vessel and cargo handling services, and it is used for the purchases of equipment and maintenance services. Of these components, only three can be isolated geographically with any degree of accuracy. These are the personal income component of revenue, which can be traced to geographic locations based on the residence of those receiving the income, the payment of state and local taxes, and the local purchases made by firms dependent upon the maritime activity. The balance of the revenue is distributed in the form of payments to firms located outside the region providing goods and services to the dependent firms and for the distribution of company profits to shareholders.

Since it is difficult to trace all the components of the revenue beneficiaries, an estimate of revenue is developed, but no conclusions are formulated as to how the revenue (other than personal income, taxes and local purchases) is distributed, geographically. It is more accurate to trace the distribution of personal income (which is a subset of revenue) through the geographic locations of individuals receiving the income, as well as the local purchases by port-dependent firms.

1. REVENUE IMPACT

In 2015 marine cargo activity at the public and private marine terminals at the Port of Beaumont supported a total of \$1.8 billion of economic activity in the State of Texas. Of the \$1.8 billion, \$137.8 million is the direct business revenue received by the firms directly dependent upon the Port and providing maritime services and inland transportation services to the cargo handled at the marine terminals and the vessels calling the ports, as well as ship repair and maintenance services. An additional \$1.5 billion represents the value of the output to the State of Texas that is created due to the cargo moving via the Port of Beaumont. This includes the value added at each stage of producing an export cargo, as well as the value added at each stage of production for the firms using imported raw materials and intermediate products that flow via the marine terminals and are consumed within the State. In addition, \$111.3 million of the re-spending of personal income and local consumption purchases are supported in the Texas economy. These components are additive and represent independent monetary impacts supported by the cargo and vessel activity. Other dollar value impact measures are not included in the total economic value since they are interdependent. Direct income is not included since it is part of the direct business impact and similarly, local purchases by the firms are from the direct business

revenue generated by port activity, and also used to pay indirect income. Finally, taxes are paid by the individuals from the direct, induced, indirect and related income and the direct business revenue and the related output.

Exhibit III-1 presents the \$137.8 million direct total revenue estimated to have been generated by port activity in 2015. This revenue includes the revenue received by firms providing services to the commodity and vessel activity at the public and private terminals, and includes revenue received by trucking firms, railroads, pipeline operations, terminal operators, tenants and dependent shippers, barge operators and towing companies, marine construction and maritime services support firms.

Exhibit III-1
Total Revenue Generated By
Port Activity

PORT OF BEAUMONT	REVENUE (\$1,000)
SURFACE TRANSPORTATION	
Rail	\$36,150
Truck	\$21,164
Pipeline	\$2,705
MARITIME SERVICES	
Terminal	\$35,528
Tug Assist	\$1,115
Pilots	\$753
Agents	\$278
Maritime Services/Construction	\$6,226
Freight Forwarders	\$7,722
Barge/Bunkers	\$2,087
Chandler/Surveyors	\$1,443
PORT OF BEAUMONT	<u>\$22,635</u>
TOTAL	\$137,808

Railroad operations receive the greatest revenue impact, followed by the terminal operators and the Port of Beaumont.

2. PERSONAL EARNINGS IMPACT

In the previous section of this chapter, the total revenue generated by port activity was identified. As described earlier, the personal income received by those directly employed due to maritime activity at the Port of Beaumont is paid from the business revenue. The income impact is estimated by multiplying the average annual earnings (excluding benefits) of each port participant, i.e., truckers, steamship agents, pilots, towing firm employees, terminal employees, government employees, etc., by the corresponding number of direct jobs in each category. The individual annual earnings in each category multiplied by the corresponding job impact resulted in \$42.0 million in personal wage and salary earnings. It is important to emphasize that the average annual earnings of a port-dependent job is about \$56,416. These relatively high paying jobs will have a much greater economic impact in the local economy through stimulating induced jobs than will a job paying lower wages.

The impact of the re-spending of this direct income for local purchases is estimated using a personal earnings multiplier. The personal earnings multiplier is based on data supplied by the Bureau of Economic Analysis (BEA), Regional Input-Output Modeling System (RIMS II). The BEA estimates that for every one dollar earned by direct employees generated by activity at the marine terminals, an additional \$2.65 of personal income and consumption expenditures would be created as a result of re-spending the income for purchases of goods and services produced in locally. Hence, a personal earnings multiplier of 3.65 was used to estimate the total income and consumption impact of \$111.3 million, inclusive of the re-spending effect. This additional re-spending of the direct income generates the 884 induced job impact, described in the previous chapter.²

The 1,091 indirect job holders earned \$51.7 million in indirect wages and salaries. The related users received \$360.4 billion. Combining the direct, induced/local consumption, indirect and related income impact, the activity at the Port of Beaumont created \$565.4 million of income and local consumption impacts on the State in 2015.

3. TAX IMPACTS

State and local tax impacts are based on per employee tax burdens which are developed at the county, local and state jurisdictional levels. These tax per employee burdens are essentially tax indices that are used to allocate total taxes at each level of government to economic activity generated by the marine terminals. To estimate the per employee tax indices, total taxes received at each governmental level in Texas were developed from Tax Foundation, which reports total state and local taxes from all sources as a percent of total personal income.

²It is to be emphasized that the re-spending impact of \$111.3 million does not represent the earnings of the 884 induced jobs. The \$111.3 million re-spending impact does include the direct earnings received by the employees holding the induced jobs, but the re-spending impact also includes the revenue received by the firms providing the goods and services to those directly employed.

Activity at the public and private marine terminals at the Port of Beaumont generated \$15.4 million of direct, induced and indirect state, county and local taxes. The related user state and local tax impact is estimated at \$27.0 million, for a total state and local tax impact of \$42.4 million in 2015.
